# Quad Video (Filter) Amplifiers with Input Sync-Tip Clamps 

## General Description

The MAX9657 is a small, low-power, quad video amplifier with input sync-tip clamps. It features a bandwidth of 15 MHz , making it suitable for not only standard-definition video signals, but also video graphics array (VGA) signals with a $640 \times 480$ resolution at up to 85 Hz refresh rate.
The MAX9658 is a quad video amplifier with integrated lowpass filters and input sync-tip clamps. The lowpass filters typically have $\pm 1 \mathrm{~dB}$ passband flatness out to 9.5 MHz and 47 dB attenuation at 27 MHz . Specially suited for composite video signals, the MAX9658 is ideal for performing anti-alias filtering at the inputs of a digital video recorder or for performing reconstruction filtering at the outputs of a SCART set-top box.
Both devices require that the incoming video signals be AC-coupled to the inputs. The input sync-tip clamps set the internal DC level of the video signals.
The amplifiers have 2V/V gain, and the outputs can be DC-coupled to a $75 \Omega$ load, which is the equivalent of two video loads, or AC-coupled to a $150 \Omega$ load.
Both the MAX9657/MAX9658 feature a low-power shutdown mode, in which supply current is reduced to $35 \mu \mathrm{~A}$.
The MAX9657/MAX9658 operate from a single 2.7 V to 3.6 V supply, are specified over the $-40^{\circ} \mathrm{C}$ to $+125^{\circ} \mathrm{C}$ automotive temperature range, and are offered in a small, 16-pin QSOP package.

Applications
Set-Top Boxes
Digital Video Recorders

Typical Application Circuits and Pin Configuration appear at end of data sheet.

- Quad Channel
- 9.5MHz, $\pm 1 \mathrm{~dB}$ Passband (MAX9658)
- 47dB Attenuation at 27MHz (MAX9658)
- Fixed Gain of 2V/V
- Low Power: 21mA
- 2.7V to 3.6V Single-Supply Operation

Ordering Information

| PART | PIN-PACKAGE | STANDARD-DEFINITION <br> VIDEO FILTER |
| :--- | :--- | :---: |
| MAX9657AEE + | 16 QSOP | No |
| MAX9658AEE + | 16 QSOP | Yes |

Note: All devices are specified over the $-40^{\circ} \mathrm{C}$ to $+125^{\circ} \mathrm{C}$ operating temperature range.
+Denotes a lead(Pb)-free/RoHS-compliant package.

## Detailed Description

The MAX9657 consists of input sync-tip clamps and gain of $2 \mathrm{~V} / \mathrm{V}$ output amplifiers capable of driving standard $150 \Omega$ loads to ground. It can be used to buffer video signals, for example, before a crosspoint matrix.
The MAX9658 filters and amplifies video signals. It is very similar to the MAX9657 except that it also has integrated lowpass filters. This device can be used to provide the anti-alias filtering before the video decoders of a digital video recorder, or it can be used to do the reconstruction filtering after a video DAC that references output signals to the positive supply.

## Input

The MAX9657/MAX9658 feature sync-tip clamps at the input that accept video signals with sync pulses Composite video with blanking and sync (CVBS) is an example of a video signal with sync pulses. The synctip voltage is internally set to 300 mV .
In shutdown mode, the inputs to the MAX9657/ MAX9658 do not distort the video signal in case the video source is driving video signals to another video circuit such as a video multiplexer. The inputs in shutdown mode are biased at $V_{\mathrm{DD}} / 3$, which is sufficiently above ground such that the ESD diodes never forward bias as the video signal changes. The input resistance is $220 \mathrm{k} \Omega$, which presents negligible loading on the video current DAC

Video Filter (MAX9658 Only)
The MAX9658 filters feature $\pm 1 \mathrm{~dB}$ passband out to 9.5 MHz and 47 dB attenuation at 27 MHz , making the filter suitable for standard-definition video signals from all sources (e.g., broadcast and DVD). Broadcast video signals are channel limited: NTSC signals have 4.2 MHz bandwidth and PAL signals have 5 MHz bandwidth. Video signals from a DVD player, however, are not channel limited, so the bandwidth of DVD video signals can approach the Nyquist limit of 6.75 MHz . Recommendation: ITU-R BT.601-5 specifies 13.5 MHz as the sampling rate for standard-definition video Therefore, the maximum bandwidth of the signal is 6.75MHz. To ease the filtering requirements, most modern video systems oversample by two times, clocking the video current DAC at 27 MHz .

## Outputs

The video output amplifiers can both source and sink load current, allowing output loads to be DC- or ACcoupled. The amplifier output stage needs approximately 300 mV of headroom from either supply rail. The devices have an internal level-shift circuit that positions the sync tip at approximately 300 mV at the output.

If the supply voltage is greater than 3.135 V ( $5 \%$ below a 3.3 V supply), each amplifier can drive two DC-coupled video loads to ground. If the supply is less than 3.135 V , each amplifier can drive only one DC-coupled or AC-coupled video load.

Shutdown
The devices draw approximately $35 \mu \mathrm{~A}$ of supply current when SHDN is low. In shutdown mode, the amplifier outputs become high impedance.

## Applications Information

## AC-Coupling the Outputs

The outputs can be AC-coupled since the output stage can source and sink current as shown in Figure 1. Coupling capacitors should be $220 \mu \mathrm{~F}$ or greater to keep the highpass filter, formed by the $150 \Omega$ equivalent resistance of the video transmission line, to a corner frequency of 4.8 Hz or below. The frame rate of PAL systems is 25 Hz , the frame rate of NTSC systems is 30 Hz , and the frame rate of VGA is usually 60 Hz or higher. The corner frequency should be well below the frame rate

Power Consumption
The quiescent power consumption and average power consumption of the MAX9657/MAX9658 are very low because of the 3.3 V operation and low-power circuit design. Quiescent power consumption is defined when the MAX9657/MAX9658 are operating without loads and without any video signals.
Average power consumption represents the normal power consumption when the devices drive real video signals into real video loads. It is measured when the MAX9657/MAX9658 drive a $150 \Omega$ load to ground with a $50 \%$ flat field, which serves as a proxy for a real video signal.
Table 1 shows the quiescent and average power consumption of the MAX9657/MAX9658.

Power-Supply Bypassing and Ground The MAX9657/MAX9658 operate from a single-supply voltage down to 2.7 V , allowing for low-power operation. Bypass VDD to GND with a $0.1 \mu \mathrm{~F}$ capacitor. Place all external components as close as possible to the device.
